**EP 1 304 110 A2**

## Description

**[0001]** The present invention relates to a series of substituted heteroaromatic compounds, methods for their preparation, pharmaceutical compositions containing them and their use in medicine. In particular, the invention relates to bioisosteres of quinoline and quinazoline derivatives which exhibit protein tyrosine kinase inhibition.

**[0002]** Protein tyrosine kinases catalyse the phosphorylation of specific tyrosyl residues in various proteins involved in the regulation of cell growth and differentiation (A.F. Wilks, *Progress in Growth Factor Research*, 1990, 2, 97-111; S.A. Courtneidge, *Dev. Supp.*, 1993, 57-64; J.A. Cooper, *Semin. Cell Biol.*, 1994, 5(6), 377-387; R.F. Paulson, *Semin. Immunol.*, 1995, 7(4), 267-277; A.C. Chan, *Curr. Opin. Immunol.*, 1996, 8(3), 394-401). Protein tyrosine kinases can be broadly classified as receptor (e.g. EGFr, c-erbB-2, c-met, tie-2, PDGFr, FGFr) or non-receptor (e.g. c-src, lck, Zap70) kinases. Inappropriate or uncontrolled activation of many of these kinase, i.e. aberrant protein tyrosine kinase activity, for example by over-expression or mutation, has been shown to result in uncontrolled cell growth.

**[0003]** Aberrant activity of protein tyrosine kinases, such as c-erbB-2, c-src, c-met, EGFr and PDGFr have been implicated in human malignancies. Elevated EGFr activity has, for example, been implicated in non-small cell lung, bladder and head and neck cancers, and increased c-erbB-2 activity in breast, ovarian, gastric and pancreatic cancers. Inhibition of protein tyrosine kinases should therefore provide a treatment for tumours such as those outlined above.

**[0004]** Aberrant protein tyrosine kinase activity has also been implicated in a variety of other disorders: psoriasis (Dvir et al, *J.Cell.Biol.*; 1991, 113, 857-865), fibrosis, atherosclerosis, restenosis, (Buchdunger et al, *Proc.Natl.Acad. Sci. USA*; 1991, 92, 2258-2262), auto-immune disease, allergy, asthma, transplantation rejection (Klausner and Samelson, *Cell*; 1991, 64, 875-878), inflammation (Berkois, *Blood*; 1992, 79(9), 2446-2454), thrombosis (Salari et al, *FEBS*; 1990, 263(1), 104-108) and nervous system diseases (Ohmichi et al, *Biochemistry*, 1992, 31, 4034-4039). Inhibitors of the specific protein tyrosine kinases involved in these diseases eg PDGF-R in restenosis and EGF-R in psoriasis, should lead to novel therapies for such disorders. P56lck and zap 70 are indicated in disease conditions in which T cells are hyperactive e.g. rheumatoid arthritis, autoimmune disease, allergy, asthma and graft rejection. The process of angiogenesis has been associated with a number of disease states (e.g. tumorigenesis, psoriasis, rheumatoid arthritis) and this has been shown to be controlled through the action of a number of receptor tyrosine kinases (L.K. Shawver, *DDT*, 1997, 2(2), 50-63).

**[0005]** EP0635507 discloses a class of tricyclic quinazoline derivatives of the formula:

wherein R<sup>1</sup> and R<sup>2</sup> together form specified optionally substituted groups containing at least one heteroatom so as to form a 5 or 6-membered ring, in which there is a N atom at the 6 position of the quinazoline ring; R<sup>3</sup> includes independently hydrogen, hydroxy, halogeno, (1-4C)alkyl, (1-4C) alkoxy di-[(1-4C)alkyl]amino, or (2-4C)alkanoylamino. The above citation notes that receptor tyrosine kinases in general, which are important in the transmission of biochemical signals initiating cell replication, are frequently present at increased levels or with higher activities in common human cancers such as breast cancer (Sainsbury et al, *Brit. J. Cancer*, 1988, 58, 458). It is suggested that inhibitors of receptor tyrosine kinase should be of value as inhibitors of the growth of mammalian cancer cells (Yaish *et al. Science*, 1988, 242, 933). This citation therefore has the aim of providing quinazoline derivatives which inhibit receptor tyrosine kinases involved in controlling the tumorigenic phenotype.

[0013] It is therefore a general object of the present invention to provide compounds suitable for the treatment of disorders mediated by protein tyrosine kinase activity, and in particular treatment of the above mentioned disorders.

[0014] In addition to the treatment of tumours, the present invention envisages that other disorders mediated by protein tyrosine kinase activity may be treated effectively by inhibition, including preferential inhibition, of the appropriate protein tyrosine kinase activity.

[0015] Broad spectrum inhibition of protein tyrosine kinase may not always provide optimal treatment of, for example tumours, and could in certain cases even be detrimental to subjects since protein tyrosine kinases provide an essential role in the normal regulation of cell growth.

[0016] It is another object of the present invention to provide compounds which preferentially inhibit protein tyrosine kinases, such as EGFR, c-erbB-2, c-erbB-4, c-met, tie-2, PDGFR, c-src, lck, Zap70, and fyn. There is also perceived to be a benefit in the preferential inhibition involving small groups of protein tyrosine kinases, for example c-erbB-2 and c-erbB-4 or c-erbB-2, c-erbB-4 and EGF-R.

[0017] A further object of the present invention is to provide compounds useful in the treatment of protein tyrosine kinase related diseases which minimise undesirable side-effects in the recipient.

[0018] The present invention relates to heterocyclic compounds which may be used to treat disorders mediated by protein tyrosine kinases and in particular have anti-cancer properties. More particularly, the compounds of the present invention are potent inhibitors of protein tyrosine kinases such as such as EGFR, c-erbB-2, c-erbB-4, c-met, tie-2, PDGFR, c-src, lck, Zap70, and fyn, thereby allowing clinical management of particular diseased tissues.

[0019] The present invention envisages, in particular, the treatment of human malignancies, for example breast, non-small cell lung, ovary, stomach, and pancreatic tumours, especially those driven by EGFR or erbB-2, using the compounds of the present invention. For example, the invention includes compounds which are highly active against the c-erbB-2 protein tyrosine kinase often in preference to the EGF receptor kinase hence allowing treatment of c-erbB-2 driven tumours. However, the invention also includes compounds which are highly active against both c-erbB-2 and EGF-R receptor kinases hence allowing treatment of a broader range of tumours.

[0020] More particularly, the present invention envisages that disorders mediated by protein tyrosine kinase activity may be treated effectively by inhibition of the appropriate protein tyrosine kinase activity in a relatively selective manner, thereby minimising potential side effects.

[0021] Accordingly, the present invention provides a compound of formula (I):

[0082] Certain compounds of formula (I) may exist in stereoisomeric forms (e.g. they may contain one or more asymmetric carbon atoms or may exhibit *cis-trans* isomerism). The individual stereoisomers (enantiomers and diastereoisomers) and mixtures of these are included within the scope of the present invention. Likewise, it is understood that compounds of formula (I) may exist in tautomeric forms other than that shown in the formula and these are also included within the scope of the present invention.

[0083] Salts of the compounds of the present invention may comprise acid addition salts derived from a nitrogen in the compound of formula (I). The therapeutic activity resides in the moiety derived from the compound of the invention as defined herein and the identity of the other component is of less importance although for therapeutic and prophylactic purposes it is, preferably, pharmaceutically acceptable to the patient. Examples of pharmaceutically acceptable acid addition salts include those derived from mineral acids, such as hydrochloric, hydrobromic, phosphoric, metaphosphoric, nitric and sulphuric acids, and organic acids, such as tartaric, acetic, trifluoroacetic, citric, malic, lactic, fumaric, benzoic, glycolic, gluconic, succinic and methanesulphonic and arylsulphonic, for example *p*-toluenesulphonic, acids.

[0084] According to a further aspect of the present invention there is provided a process for the preparation of a compound of formula (I) as defined above which comprises the steps:

(a) the reaction of a compound of formula (II)

wherein A, X, n, p and R² are as defined above and L, L' and L'' are suitable leaving groups, with a compound of formula (III)

wherein U and Y are as defined above, to prepare a compound of formula (IV)

and subsequently (b) where n is 1, reaction with an appropriate reagent to substitute the group R'' onto the ring A by

replacement of the leaving group L'; and (c) where p is other than 0, reaction with appropriate reagent(s) to substitute the group(s) R<sup>1</sup> onto the ring A by replacement of the leaving group(s) L'; and, if desired, (d) subsequently converting the compound of formula (I) thereby obtained into another compound of formula (I) by means of appropriate reagents.

[0085] Alternatively, the compound of formula (II) as defined above is reacted with the appropriate reagents to substitute the groups R'' and R<sup>1</sup> onto the ring A by replacement of the respective leaving groups and then the product thereby obtained (of formula (V) below) is reacted with the compound of formula (III) as defined above, followed, if desired, by conversion of the compound of formula (I) thereby obtained into another compound of formula (I).

[0086] In a variant of this alternative the compound of formula (V)

may be prepared by the reaction of a compound of formula (VI)

with appropriate reagents to substitute the group(s) R<sup>1</sup> and the group R'' onto the ring A to prepare a compound of formula (VII)

and subsequent reaction to incorporate the leaving group L. For example, a chloro leaving group can be incorporated by reaction of a corresponding 3,4-dihydropyrimidone with carbon tetrachloride/triphenylphosphine in an appropriate solvent.

[0087] Simplified versions of these general processes will apply where either (i) p is 0 and n is 1 or (ii) where n is 0 and p is other than 0.

[0088] The group R'' may, therefore, be substituted onto the ring A by replacement of a suitable leaving group. This is especially suitable for preparing compounds where R'' is a substituted or unsubstituted phenyl or heterocyclic ring system; such compounds may, for example, be prepared by reaction of the corresponding aryl or heteroaryl stannane derivative with the corresponding compound of formula (IV) carrying the leaving group L' in the appropriate position on the ring.

[0089] The group(s) R<sup>1</sup> may, therefore, also be substituted onto the ring A by replacement of suitable leaving group(s). This is especially suitable for preparing compounds of formula (I) wherein an R<sup>1</sup> group is linked to the ring A by a nitrogen atom; such compounds may, for example, be obtained by reaction of the amine corresponding to the group R<sup>1</sup> with the corresponding compound carrying a halo substituent in the appropriate position on the ring A.

[0090] The reagents used to effect the substitution of the groups  $R''$  and  $R^1$  onto the ring A may, in certain circumstances, include appropriate protecting group(s) well known to the person skilled in the art for particular functionalities. This may, for example, be suitable where either of the groups  $R''$  or  $R^1$  contain a free amino functionality. Such protecting group(s) would be removed by standard methods after the substitution onto the ring A has been effected. For a description of protecting groups and their use see T.W. Greene and P.G.M. Wuts, "Protective Groups in Organic Synthesis", 2nd edn., John Wiley & Sons, New York, 1991.

[0091] According to a further aspect of the present invention there is provided a process for the preparation of a compound of formula (I) as defined above which comprises the steps:

- (a) reacting a compound of formula (IV) as defined above with appropriate reagent(s) to prepare a compound wherein either the group  $L'$  (when  $n=1$ ) or the group(s)  $L''$  (when  $p$  is other than 0) is(are) replaced with an appropriately functionalised group Z;
- and (b) subsequently converting the group Z into the group  $R''$  where  $L'$  has been replaced or into the group  $R^1$  where  $L''$  has been replaced by means of appropriate reagent(s);
- (c) reacting with appropriate reagents to substitute the other of  $R^1$  and  $R''$  onto the ring A by replacement of the remaining leaving group  $L''$  and  $L'$  respectively, if present; and, if desired, (d) subsequently converting the compound of formula (I) thereby obtained into another compound of formula (I) by means of appropriate reagents.

[0092] Such processes are particularly suitable for the preparation of compounds of formula (I) wherein either  $R''$  carries or  $R^1$  represents a substituent selected from  $M^1-M^2-M^3-M^4$ ,  $M^1-M^5$  or  $M^1-M^2-M^3-M^6$  as defined above in which  $M^2$  represents  $NR^{12}$ . In such cases preferably the group Z carries a terminal formyl group (CHO).

[0093] Such processes are especially suitable for the preparation of compounds of formula (I) wherein either (i)  $p$  is 0,  $n$  is 1 and  $R''$  carries a substituent selected from  $M^1-M^2-M^3-M^4$ ,  $M^1-M^5$  or  $M^1-M^2-M^3-M^6$  as defined above in which  $M^2$  represents  $NR^{12}$ , or (ii)  $p$  is 1,  $n$  is 0 and  $R^1$  is selected from  $M^1-M^2-M^3-M^4$ ,  $M^1-M^5$  or  $M^1-M^2-M^3-M^6$  as defined above in which  $M^2$  represents  $NR^{12}$ .

[0094] Where Z carries a formyl group the compound may be suitably prepared from the corresponding dioxolanyl substituted compound, for example by acid hydrolysis. The dioxolanyl substituted compound may be prepared by reaction of a compound of formula (IV) with an appropriate reagent to substitute the relevant leaving group with the substituent carrying the dioxolanyl ring. This reagent could, for example, be an appropriate heteroaryl stannane derivative.

[0095] Where Z carries a terminal formyl group the compound could suitably be prepared by reaction of a compound of formula (IV) with an appropriate heteroaryl stannane derivative. This derivative is either readily available or can be readily synthesised by those skilled in the art using conventional methods of organic synthesis. Suitable possibilities for preparation of compounds where  $R''$  carries the aforementioned substituents include the following schematic examples:-

[0096] The resulting compounds would, for example, then be converted into the respective stannane derivative.

[0097] Analogous methods could be used for phenyl and other heterocyclic ring systems and also for the preparation of compounds where R<sup>1</sup> represents one of the aforementioned substituents.

5 [0098] Therefore a suitable process may comprise reaction of the compound in which the group Z carries a terminal formyl group (i.e. a -CHO or -(C<sub>1-3</sub> alkylene)-CHO group) with a compound of formula HM<sup>2</sup>-M<sup>3</sup>-M<sup>4</sup>, a compound of formula HM<sup>2</sup>-M<sup>3</sup>-M<sup>6</sup> or a compound of formula HM<sup>5</sup>, wherein M<sup>2</sup> represents NR<sup>12</sup>. The reaction preferably involves a reductive amination by means of an appropriate reducing agent, for example sodium triacetoxyborohydride.

10 [0099] A similar process would be involved where in M<sup>1</sup> one CH<sub>2</sub> group was replaced with a CO group and M<sup>2</sup> was NR<sup>12</sup>. If necessary, in certain circumstances, the ketone could be protected by standard methods to ensure that the reductive amination involved the aldehyde functionality.

[0100] For the preparation of those compounds wherein in M<sup>1</sup> the CH<sub>2</sub> group adjacent to M<sup>2</sup> is replaced with a CO group a suitable process would comprise reaction of a compound in which the group Z carries a -(C<sub>0-3</sub> alkylene)-CO<sub>2</sub>H group with a compound of formula HM<sup>2</sup>-M<sup>3</sup>-M<sup>4</sup>, a compound of formula HM<sup>2</sup>-M<sup>3</sup>-M<sup>6</sup> or a compound of formula HM<sup>5</sup>, wherein M<sup>2</sup> represents NR<sup>12</sup>.

15 [0101] Alternatively, an analogous scheme to those described above could be used wherein the substitution of the groups R<sup>n</sup> and R<sup>1</sup> onto the ring A occurs prior to the coupling reaction with the compound of formula (III).

[0102] According to a further alternative process the group Z is converted into the group R<sup>n</sup> by a *de novo* synthesis of a substituted or unsubstituted heterocyclic ring system using appropriate reagents. Such a process would involve standard synthetic methodology known to the person skilled in the art for building up the heterocyclic ring system.

20 [0103] For example, Z could suitably represent an alkyne group which when reacted with an appropriate nitrile oxide results in the formation of an isoxazole ring system; reaction with an azide would result in the formation of a triazole ring system. The group Z could also suitably represent an amidoxime group (derived from a cyano group) which when reacted with an activated carboxylic acid derivative (such as an acid chloride or an acid imidazolidine) would result in the formation of a 1,2,4-oxadiazole ring system. The group Z could also suitably represent a bromomethylenecarbonyl group which would be reacted with an imidate to result in the formation of an oxazole ring system, with a guanidino group to result in the formation of an N-imidazole ring system or with an amidine group to result in the formation of a C-imidazole ring system. The group Z could also suitably represent an activated carboxylic acid group which would be reacted to form a hydrazinoketone which would subsequently be reacted with another activated carboxylic acid derivative to result in the preparation of a 1,3,4-oxadiazole ring system. Thus reaction of a compound carrying a relevant Z group with appropriate reagents carrying one of -C=N=O, -NH-C(NH<sub>2</sub>)=NH, -COX, -C(NH<sub>2</sub>)=NOH, -C(OMe)=NH, or -C(NH<sub>2</sub>)=NH as a terminal group would result in the formation of the ring systems indicated above.

30 [0104] Alternatively, an analogous scheme to those described above could be used wherein the substitution of the group R<sup>n</sup> onto the ring A occurs prior to the coupling reaction with the compound of formula (III).

35 [0105] The following scheme outlines, for example, the synthesis of derivatives carrying a substituted 1,3,4-oxadiazole ring as an R<sup>n</sup> substituent:

40

[0106] Such processes are particularly suitable for the preparation of the compounds of formula (I) wherein R<sup>n</sup> carries a substituent selected from M<sup>1</sup>-M<sup>2</sup>-M<sup>3</sup>-M<sup>4</sup>, M<sup>1</sup>-M<sup>5</sup> or M<sup>1</sup>-M<sup>2</sup>-M<sup>3</sup>-M<sup>6</sup> as defined above in which M<sup>2</sup> represents CR<sup>12</sup>R<sup>13</sup>, including those in which in M<sup>1</sup> one CH<sub>2</sub> group is replaced by a CO group.

[0107] Such processes are especially suitable for the preparation of compounds of formula (I) wherein either (i) p is 0, n is 1 and R<sup>n</sup> carries a substituent selected from M<sup>1</sup>-M<sup>2</sup>-M<sup>3</sup>-M<sup>4</sup>, M<sup>1</sup>-M<sup>5</sup> or M<sup>1</sup>-M<sup>2</sup>-M<sup>3</sup>-M<sup>6</sup> as defined above in which M<sup>2</sup> represents CR<sup>12</sup>R<sup>13</sup>, or (ii) p is 1, n is 0 and R<sup>1</sup> is selected from M<sup>1</sup>-M<sup>2</sup>-M<sup>3</sup>-M<sup>4</sup>, M<sup>1</sup>-M<sup>5</sup> or M<sup>1</sup>-M<sup>2</sup>-M<sup>3</sup>-M<sup>6</sup> as defined above in which M<sup>2</sup> represents CR<sup>12</sup>R<sup>13</sup>.

[0108] Suitable leaving groups for L, L' and L'' will be well known to those skilled in the art and include, for example, halo such as chloro and bromo; sulphonyloxy groups such as methanesulphonyloxy and toluene-p-sulphonyloxy; alkoxy groups; and triflate.

[0109] The coupling reaction referred to above with the compound of formula (II) is conveniently carried out in the

presence of a suitable inert solvent, for example a C<sub>1-4</sub> alkanol, such as isopropanol, a halogenated hydrocarbon, an ether, an aromatic hydrocarbon or a dipolar aprotic solvent such as acetone or acetonitrile at a non-extreme temperature, for example from 0 to 150°, suitably 10 to 100°C, preferably 50 to 100°C.

[0110] Optionally, the reaction is carried out in the presence of a base when Y = NH. Examples of suitable bases include an organic amine such as triethylamine, or an alkaline earth metal carbonate, hydride or hydroxide, such as sodium or potassium carbonate, hydride or hydroxide. When YH = OH or SH it is necessary to perform the reaction in the presence of a base, and in such a case the product is not obtained as the salt.

[0111] The compound of formula (I) in the case in which Y = NR<sup>p</sup> may be obtained from this process in the form of a salt with the acid HL, wherein L is as hereinbefore defined, or as the free base by treating the salt with a base as hereinbefore defined.

[0112] The compounds of formulae (II) and (III) as defined above, the reagents to substitute the group(s) R<sup>1</sup> and the group R<sup>n</sup>, and the reagent(s) to convert the group Z into the group R<sup>1</sup> or R<sup>n</sup> are either readily available or can be readily synthesised by those skilled in the art using conventional methods of organic synthesis.

[0113] As indicated above, the compound of formula (I) prepared may be converted to another compound of formula (I) by chemical transformation of the appropriate substituent or substituents using appropriate chemical methods (see for example, J. March "Advanced Organic Chemistry", Edition III, Wiley Interscience, 1985).

[0114] For example, a group R<sup>1</sup> may be substituted onto the ring A by replacement of another group R<sup>1</sup> which is a suitable leaving group. This is especially suitable for preparing compounds of formula (I) wherein an R<sup>1</sup> group is linked to the ring A by a nitrogen atom; such compounds may, for example, be obtained by reaction of the amine corresponding to the group R<sup>1</sup> with the corresponding compound of formula (I) carrying a halo substituent in the appropriate position on the ring A.

[0115] Similarly a group R<sup>n</sup> may be substituted onto the ring A by replacement of a group R<sup>1</sup> which is a suitable leaving group. This is especially suitable for preparing compounds where R<sup>n</sup> is a phenyl or heterocyclic ring system; such compounds may, for example, be prepared by reaction of the corresponding aryl or heteroaryl stannane derivative with the corresponding compound of formula (I) carrying a halo substituent in the appropriate position on the ring A.

[0116] For example, a compound containing an alkyl or aryl mercapto group may be oxidised to the corresponding sulphonyl or sulphonyl compound by use of an organic peroxide (e.g. benzoyl peroxide) or suitable inorganic oxidant (eg OXONE®).

[0117] A compound containing a nitro substituent may be reduced to the corresponding amino-compound, e.g. by use of hydrogen and an appropriate catalyst (if there are no other susceptible groups) or by use of Raney Nickel and hydrazine hydrate.

[0118] Amino or hydroxy substituents may be acylated by use of an acid chloride or an anhydride under appropriate conditions. Equally an acetate or amide group may be cleaved to the hydroxy or amino compound respectively by treatment with, for example, dilute aqueous base.

[0119] In addition reaction of an amino substituent with triphosgene and another amine (eg aqueous ammonia, dimethylamine) gives the urea substituted product.

[0120] An amino substituent may also be converted to a dimethylamino substituent by reaction with formic acid and sodium cyanoborohydride.

[0121] A formyl substituent may be converted to a hydroxymethyl or a carboxy substituent by standard reduction or oxidation methods respectively.

[0122] All of the above-mentioned chemical transformations may also be used to convert one compound of formula (II) to a further compound of formula (II) prior to any subsequent reaction; or to convert one compound of formula (II) to a further compound of formula (III) prior to any subsequent reaction.

[0123] Various intermediate compounds used in the above-mentioned processes, including but not limited to certain of the compounds of formulae (II), (III), (IV), (V), (VI) and (VII) as illustrated above, are novel and thus represent a further aspect of the present invention.

[0124] The compounds of formula (I) and salts thereof have anticancer activity as demonstrated hereinafter by their inhibition of the protein tyrosine kinase c-erbB-2, c-erbB-4 and/or EGF-r enzymes and their effect on selected cell lines whose growth is dependent on c-erbB-2 or EGF-r tyrosine kinase activity.

[0125] The present invention thus also provides compounds of formula (I) and pharmaceutically acceptable salts or solvates thereof for use in medical therapy, and particularly in the treatment of disorders mediated by aberrant protein tyrosine kinase activity such as human malignancies and the other disorders mentioned above. The compounds of the present invention are especially useful for the treatment of disorders caused by aberrant c-erbB-2 and/or EGF-r activity such as breast, ovarian, gastric, pancreatic, non-small cell lung, bladder, head and neck cancers, and psoriasis.

A further aspect of the invention provides a method of treatment of a human or animal subject suffering from a disorder mediated by aberrant protein tyrosine kinase activity, including susceptible malignancies, which comprises administering to said subject an effective amount of a compound of formula (I) or a pharmaceutically acceptable salt or solvate thereof.

[0126] A further aspect of the present invention provides the use of a compound of formula (I), or a pharmaceutically acceptable salt or solvate thereof, in therapy.

[0127] A further aspect of the present invention provides the use of a compound of formula (I), or a pharmaceutically acceptable salt or solvate thereof, in the preparation of a medicament for the treatment of cancer and malignant tumours.

[0128] A further aspect of the present invention provides the use of a compound of formula (I), or a pharmaceutically acceptable salt or solvate thereof, in the preparation of a medicament for the treatment of psoriasis.

[0129] Whilst it is possible for the compounds, salts or solvates of the present invention to be administered as the new chemical, it is preferred to present them in the form of a pharmaceutical formulation.

[0130] According to a further feature of the present invention there is provided a pharmaceutical formulation comprising at least one compound of formula (I), or a pharmaceutically acceptable salt or solvate thereof, together with one or more pharmaceutically acceptable carriers, diluents or excipients.

[0131] Pharmaceutical formulations may be presented in unit dose forms containing a predetermined amount of active ingredient per unit dose. Such a unit may contain for example 0.5mg to 1g, preferably 70mg to 700mg, more preferably 5mg to 100mg of a compound of the formula (I) depending on the condition being treated, the route of administration and the age, weight and condition of the patient.

[0132] Pharmaceutical formulations may be adapted for administration by any appropriate route, for example by the oral (including buccal or sublingual), rectal, nasal, topical (including buccal, sublingual or transdermal), vaginal or parenteral (including subcutaneous, intramuscular, intravenous or intradermal) route. Such formulations may be prepared by any method known in the art of pharmacy, for example by bringing into association the active ingredient with the carrier(s) or excipient(s).

[0133] Pharmaceutical formulations adapted for oral administration may be presented as discrete units such as capsules or tablets; powders or granules; solutions or suspensions in aqueous or non-aqueous liquids; edible foams or whips; or oil-in-water liquid emulsions or water-in-oil liquid emulsions.

[0134] Pharmaceutical formulations adapted for transdermal administration may be presented as discrete patches intended to remain in intimate contact with the epidermis of the recipient for a prolonged period of time. [0135] Pharmaceutical formulations adapted for topical administration may be formulated as ointments, creams, suspensions, lotions, powders, solutions, pastes, gels, sprays, aerosols or oils.

[0136] For treatments of the eye or other external tissues, for example mouth and skin, the formulations are preferably applied as a topical ointment or cream. When formulated in an ointment, the active ingredient may be employed with either a paraffinic or a water-miscible ointment base. Alternatively, the active ingredient may be formulated in a cream with an oil-in-water cream base or a water-in-oil base.

[0137] Pharmaceutical formulations adapted for topical administrations to the eye include eye drops wherein the active ingredient is dissolved or suspended in a suitable carrier, especially an aqueous solvent.

[0138] Pharmaceutical formulations adapted for topical administration in the mouth include lozenges, pastilles and mouth washes.

[0139] Pharmaceutical formulations adapted for rectal administration may be presented as suppositories or as enemas.

Suitable formulations wherein the carrier is a liquid, for administration as a nasal spray or as nasal drops, include aqueous or oil solutions of the active ingredient.

[0141] Pharmaceutical formulations adapted for administration by inhalation include fine particle dusts or mists which may be generated by means of various types of metered dose pressurised aerosols, nebulizers or insufflators.

[0142] Pharmaceutical formulations adapted for vaginal administration may be presented as pessaries, tampons, creams, gels, pastes, foams or spray formulations.

[0143] Pharmaceutical formulations adapted for parenteral administration include aqueous and non-aqueous sterile injection solutions which may contain anti-oxidants, buffers, bacteriostats and solutes which render the formulation isotonic with the blood of the intended recipient; and aqueous and non-aqueous sterile suspensions which may include suspending agents and thickening agents. The formulations may be presented in unit-dose or multi-dose containers, for example sealed ampoules and vials, and may be stored in a freeze-dried (lyophilized) condition requiring only the addition of the sterile liquid carrier, for example water for injections, immediately prior to use. Extemporaneous injection solutions and suspensions may be prepared from sterile powders, granules and tablets.

[0144] Preferred unit dosage formulations are those containing a daily dose or sub-dose, as herein above recited, or an appropriate fraction thereof, of an active ingredient.

[0145] It should be understood that in addition to the ingredients particularly mentioned above, the formulations may include other agents conventional in the art having regard to the type of formulation in question, for example those suitable for oral administration may include flavouring agents.

[0146] The animal requiring treatment with a compound, salt or solvate of the present invention is usually a mammal, such as a human being.

[0147] A therapeutically effective amount of a compound, salt or solvate of the present invention will depend upon a number of factors including, for example, the age and weight of the animal, the precise condition requiring treatment and its severity, the nature of the formulation, and the route of administration, and will ultimately be at the discretion of the attendant physician or veterinarian. However, an effective amount of a compound of the present invention for the treatment of neoplastic growth, for example colon or breast carcinoma will generally be in the range of 0.1 to 100 mg/kg body weight of recipient (mammal) per day and more usually in the range of 1 to 10 mg/kg body weight per day. Thus, for a 70kg adult mammal, the actual amount per day would usually be from 70 to 700 mg and this amount may be given in a single dose per day or more usually in a number (such as two, three, four, five or six) of sub-doses per day such that the total daily dose is the same. An effective amount of a salt or solvate of the present invention may be determined as a proportion of the effective amount of the compound *per se*.

[0148] The compounds of the present invention and their salts and solvates may be employed alone or in combination with other therapeutic agents for the treatment of the above-mentioned conditions. In particular, in anti-cancer therapy, combination with other chemotherapeutic, hormonal or antibody agents is envisaged. Combination therapies according to the present invention thus comprise the administration of at least one compound of formula (I) or a pharmaceutically acceptable salt or solvate thereof and at least one other pharmaceutically active agent. The compound(s) of formula (I) and the other pharmaceutically active agent(s) may be administered together or separately and, when administered separately this may occur simultaneously or sequentially in any order. The amounts of the compound(s) of formula (I) and the other pharmaceutically active agent(s) and the relative timings of administration will be selected in order to achieve the desired combined therapeutic effect.

[0149] Certain embodiments of the present invention will now be illustrated by way of example only. The physical data given for the compounds exemplified is consistent with the assigned structure of those compounds.

[0150] <sup>1</sup>H NMR spectra were obtained at 500MHz on a Bruker AMX500 spectrophotometer, on a Bruker spectrophotometer at 300Mz, or on a Bruker AC250 or Bruker AM250 spectrophotometer at 250MHz. J values are given in Hz. Mass spectra were obtained on one of the following machines: VG Micromass Platform (electrospray positive or negative), HP5989A Engine (thermospray positive) or Finnigan-MAT LCQ (ion trap) mass spectrometer. Analytical thin layer chromatography (tlc) was used to verify the purity of some intermediates which could not be isolated or which were too unstable for full characterisation, and to follow the progress of reactions. Unless otherwise stated, this was done using silica gel (Merck Silica Gel 60 F254). Unless otherwise stated, column chromatography for the purification of some compounds used Merck Silica gel 60 (Art. 1.09385, 230-400 mesh), and the stated solvent system under pressure.

## General Procedures

### (A) Reaction of an amine with a bicyclic species containing a 4-chloropyrimidine ring

[0152] The optionally substituted bicyclic species and the specified amine were mixed in an appropriate solvent (acetonitrile unless otherwise specified), and heated to reflux. When the reaction was complete (as judged by tlc), the reaction mixture was allowed to cool. The resulting suspension was diluted, e.g. with acetone, and the solid collected by filtration, washing e.g. with excess acetone, and dried at 60°C *in vacuo*, giving the product as the hydrochloride salt. If the free base was required (e.g. for further reaction), this was obtained by treatment with a base e.g. triethylamine; purification by chromatography was then performed, if required.

(B) Reaction of a product from Procedure (A) with a heteroaryl tin reagent

[0153] A stirred mixture of the product from Procedure (A), (containing a suitable leaving group such as chloro, bromo, iodo or triflate), a heteroaryl stannane and a suitable palladium catalyst, such as bis-(triphenylphosphine)palladium (II) chloride or 1,4-bis(diphenylphosphino)-butane palladium (II) chloride (prepared as described in C.E. Housecroft et. al., Inorg. Chem., (1991), 30(1), 125-130), together with other appropriate additives, were heated at reflux in dry dioxane or another suitable solvent under nitrogen until the reaction was complete. The resulting mixture was generally purified by chromatography on silica.

(C) Reaction of the product from Procedure (A) with a second amine

[0154] The product of Procedure (A) (containing a suitable leaving group such as chloro) was dissolved in an excess of the desired amine (or a solution thereof) and heated in a pressure vessel (e.g. at 130°C for 17hr). The cooled mixture was generally purified by chromatography on silica.

Preparation Of Intermediates1-Benzyl-5-nitro-1H-indole

[0155] Dry dimethylsulphoxide (20 ml) was added to potassium hydroxide (4.2 g, 0.074 mol) (crushed pellets) and the mixture was stirred under nitrogen for 5 mins. 5-Nitroindole (commercially available) (3.0 g, 0.019 mol) was then added and the red mixture stirred for 30 min at room temperature. The mixture was then cooled to -10 °C, benzyl bromide (4.4 ml, 0.037 mol) was slowly added and the mixture stirred and allowed to warm to room temperature over a period of 40 mins. Water (50 ml) was then added and the mixture was extracted with diethyl ether (2 x 200 ml). The extracts were washed with water (4 x 50 ml), dried over sodium sulphate and evaporated to leave an oily solid. The excess benzyl bromide was removed by dissolving the whole in diethyl ether (50 ml), diluting this solution with 40-60 petrol (50 ml) and then gradually removing the diethyl ether *in vacuo* to leave a yellow solid suspended in the petrol. The solid was filtered, washed with copious amounts of 40-60 petrol and dried to give 1-benzyl-5-nitroindole (2.4 g, 51%) as a yellow solid, m.p. 102-104 °C;  $\delta$ H [ $^2$ H<sub>6</sub>]-DMSO 8.53 (1H, s, 4-H), 8.00 (1H, d, J 9, 6-H), 7.78 (1H, s, 2-H), 7.68 (1H, d, J 9, 7-H), 7.36-7.20 (5H, m, 2'-H, 3'-H, 4'-H, 5'-H, 6'-H), 6.81 (1H, s, 3-H), 5.52 (2H, s, CH<sub>2</sub>).

5-Amino-1-benzyl-1H-indole

[0156] A solution of 1-benzyl-5-nitroindole (0.51 g, 0.02 mol) in a mixture of ethyl acetate (25 ml) and methanol (25 ml) was carefully added to 10% palladium on charcoal (45 mg). The resulting suspension was stirred at room temperature under an atmosphere of hydrogen. When the reaction was complete (indicated by tic or calculated uptake of hydrogen) the suspension was filtered through a pad of Hyflo™, and the filtrate evaporated to dryness to give 5-amino-1-benzylindole (0.40 g, 91%) as an off-white solid; m.p. 66-68 °C;  $\delta$ H [ $^2$ H<sub>6</sub>]-DMSO 7.30-7.12 (6H, m, 2-H, 2'-H, 3'-H, 4'-H, 5'-H, 6'-H), 7.08 (1H, d, J 8, 7-H), 6.70 (1H, s, 4-H), 6.49 (1H, d, J 8, 6-H), 6.18 (1H, s, 3-H), 5.28 (2H, s, CH<sub>2</sub>), 4.38 (2H, br s, NH<sub>2</sub>).

The reaction was then cooled and water (500ml) was gradually added to precipitate the product which was filtered off and washed with water (50ml) and dried in the air at ambient temperature. The weight of pale yellow solid thus obtained was 72.3g (93%), m.pt. 95-97°C; HPLC (Partisil 5, dichloromethane, 4ml/min, 250nm) gave an isomer ratio (1-*N*-benzyl : 2-*N*-benzyl) of 63:37 (RT-1 *N* 3.4min, RT-2 *N* 6.6min). To a filtered solution of the mixed regioisomers (100g) in acetone (470ml) at room temperature was added, gradually with stirring, water (156ml) and the mixture was stirred for one hour. The resultant yellow crystalline solid was filtered off and dried in the air at ambient temperature to give 36.4g (34%) of material; m. pt. 124-126°C; HPLC showed an isomer ratio (1-*N*-benzyl : 2-*N*-benzyl) of 96:4;  $\delta$ H (CDCl<sub>3</sub>) 5.58 (2H,s,CH<sub>2</sub>), 7.12-7.15 (2H) & 7.22-7.29(3H)-(phenyl), 7.33(1H,dt, J=1 Hz & 9Hz, H-7), 8.15(1H,dd, J=2Hz & 9Hz,H-6), 8.19(1H,d,J=1Hz,H-3), 8.67 (1H,dd,J=1Hz & 2Hz, H-4).

The micro-organism was stored frozen (-80°C) on porous beads in cryovials containing cryopreservative (Microbank™ beads, Richmond Hill, Ontario, Canada). A single bead was used to inoculate each of 2 x 50ml aliquots of culture medium (SB1) dispensed in 250ml Erlenmeyer flasks.

[0229] The microorganism was grown in SB1 medium at a temperature of 28°C. Flasks were shaken at 250rpm. The SB1 culture medium consisted of Arkasoy (25g; British Arcady Company), Bacto yeast extract (5g; Difco Laboratories) and KH<sub>2</sub>PO<sub>4</sub> (5g) in distilled water (900ml). The pH of the culture medium was adjusted to 7.2 using conc. NaOH prior to autoclaving (15min/121°C). 100ml of a 20% (w/v) solution of glucose (filter sterilised) was added post sterilisation.

#### Biological Data

[0233] Compounds of the present invention were tested for protein tyrosine kinase inhibitory activity in substrate phosphorylation assays and cell proliferation assays.

[0234] The substrate phosphorylation assays use baculovirus expressed, recombinant constructs of the intracellular domains of c-erbB-2 and c-erbB-4 that are constitutively active and EGFR isolated from solubilised A431 cell membranes. The method measures the ability of the isolated enzymes to catalyse the transfer of the  $\gamma$ -phosphate from ATP

onto tyrosine residues in a biotinylated synthetic peptide (Biotin-GluGluGluGluTyrPheGluLeuVal). The enzyme is incubated for 30 minutes, at room temperature, with 10mM  $\text{MnCl}_2$ , ATP and peptide at Km concentrations, and test compound (diluted from a 5mM stock in DMSO, final DMSO concentration is 2%) in 40mM HEPES buffer, pH 7.4. The reaction is stopped by the addition of EDTA (final concentration 0.15mM) and a sample is transferred to a streptavidin-coated 96-well plate. The plate is washed and level of phosphotyrosine on the peptide is determined using a Europium-labelled antiphosphotyrosine antibody and quantified with a time-resolved fluorescence technique. The results are shown in Table 1 as the  $\text{IC}_{50}$  values in nM.

**[0235]** The cell proliferation assay uses an immortalised human breast epithelial cell line (HB4a) which has been transformed by over-expression of c-erbB-2. Growth of these cells in low serum is dependent upon the c-erbB-2 tyrosine kinase activity. The specificity of the effect of the test compounds on tyrosine kinase dependent growth over general toxicity is assessed by comparison to an HB4a cell line which has been transfected with ras. Cells are plated at 3000/well in 96-well plates in 0.1 ml medium and allowed to attach overnight. test compound is added in 0.1 ml medium, with a final concentration of 0.5% DMSO, and the plates incubated for 4 days at 37°C. The cells are then examined microscopically for evidence of morphological detransformation and cell mass is estimated by staining with methylene blue and measuring the absorbance at 620nm. The results are shown in Table 1 below as the  $\text{IC}_{50}$  values in nM. Activity against a range of naturally occurring EGFR or c-erbB-2 over-expressing human tumour cell lines (BT474-breast, HN5-head and neck, N87-gastric and Calu3-lung) is assessed with selected compounds by the same methodology. The results are also shown in Table 1 below as the  $\text{IC}_{50}$  values in nM.
